

RETELL AI — TOPIC 9

Telephony Integrations (Twilio / Vonage)

Assessment Report

Prepared by: Shaik Mohammad Shaheed

Agent: Trainee_Sarah_Receptionist

Simulation test case: Appointment_Booking_Test

Project Status: Partial implementation — simulation test case created and exported; simulation execution and live telephony integration are not verified.

1. Objective

The objective is to explore telephony integration for a Retell AI agent using a carrier platform such as Twilio or Vonage, and document configuration and verification status.

2. Retell AI Agent

The agent used is **Trainee_Sarah_Receptionist**. The visible configuration showed GPT 5.6 Terra, Cimo voice, and English (US).

3. Simulation Test Case

A simulation test case named **Appointment_Booking_Test** was created in Retell AI Simulation Testing. User prompt: *Hi, I'd like to book an appointment for tomorrow at 3 PM. My name is John.*

Success criteria: The agent should greet the caller, understand the appointment request, confirm the requested date and time, ask for missing details one question at a time, and avoid inventing information.

4. Exported Test Configuration

The test case was exported as JSON. It contains the test name, prompt, success criteria, empty dynamic variables and tool mocks, and model setting GPT-4.1 Mini. Exporting the configuration does not mean the test was executed.

5. Twilio Access Limitation

The Twilio Console displayed an upgrade prompt stating that the account was using a trial account and that adding funds was required to access the full platform. Accessing Elastic SIP Trunking and phone-number features led to this upgrade page. No paid upgrade was performed.

6. Verification Status

Item	Status
Retell agent configuration inspected	Observed

Item	Status
Simulation test case created	Completed
Simulation JSON exported	Completed
Simulation test executed	Not executed / no result captured
Twilio phone number or SIP trunk configured	Not verified
Real inbound/outbound call tested	Not completed
Vonage integration	Not completed

7. Evidence

Evidence supplied: Retell agent configuration screenshot, Simulation Testing test-case screenshot, exported JSON configuration, Twilio upgrade prompt screenshot, and Loom demonstration link:

<https://www.loom.com/share/a4e7fa669b0d49b2b71dfc5072292d4a>

8. Conclusion and Next Steps

The work demonstrates agent configuration review, creation of a simulation test case, export of its JSON configuration, and investigation of the Twilio trial restriction. Live carrier configuration and a real phone call were not verified. Ask the instructor whether the documented limitation and partial evidence are acceptable; complete carrier setup and call verification if approved access becomes available.

Accuracy note: This report distinguishes configured/exported artifacts from executed tests and live telephony integration. No simulation pass result or successful real call is claimed.
